

IT Asset Discovery Assessment - See Everything

Gain a comprehensive overview of what devices are connected to your network

People don't trust IT asset systems as they are not up to date and often incomplete. This becomes a critical issue when relying on asset systems for security. With Rebasoft you can...

“

Benefits

- **Visibility** of all devices (Hardware and Software) connected to your network in real-time so you know what to protect
- **Audit** of hardware and software to show areas of consolidation to save money and efficiency, allowing the removal of unwanted hardware and software
- **Understanding** of the “as is” state of the environment to identify any security gaps
- **Aligned** to security controls and cyber security standards in real-time making you more secure

Deliverables

- **Number** of all discovered devices connected (endpoint and network)
- **Identify** any unknown devices and reason why
- **List** of discovered end points by model, vendor and OS
- **View** list of installed applications by, browser, email client and office apps
- **List** of subdomains and services open to the internet
- **Custom report** with recommendations for instant and ongoing improvement

“With Rebasoft I can now see all my network attached devices - in one system - and validate them for compliance purposes”

CISO, charity

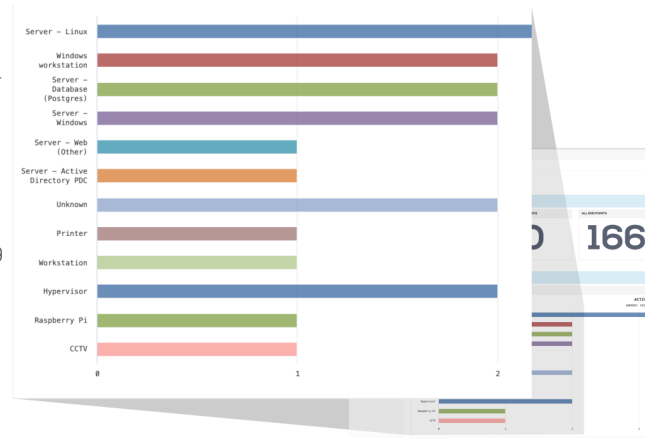

An asset discovery assessment is the first step to securing your network and achieving compliance

IT teams are struggling to answer a basic question - “what do we actually have?”

IT asset systems are built for business operations, this often means they miss systems which poses issues for security teams.

Active scans only provide a “snapshot” of your network. What happens if a device isn’t connected during the scan? You’ll never know it’s there. Over time a “drift” builds between your “snapshot” and what you actually have, leaving gaps in what you can see. You can install agents, but what happens when you can’t?

Typically asset management programs are also isolated, putting a lot of work on your IT team who have to manually import and export data between programs. What should be simple day-to-day tasks become tedious, repetitive exercises spanning multiple programs. Your IT team is already short staffed and overstretched.

The Asset Discovery Assessment utilises Rebasoft agentless asset discovery and management system, providing real-time data of everything connected to the network.

- **Find everything** with network based discovery
- **Integrated discovery** with data collected from multiple managers
- **Identify** unknown/rogue systems
- **No disruptions** - it’s lightweight, so you can see what you want, when you want
- **Simple** - there’s no need to install any additional hardware or software
- **Feeds directly into other processes** like secure configuration & vulnerability management

So, you’ll finally be able to say with confidence “this is what we have.”

But that’s just the start...

Using the Asset Discovery Assessment as a base, you’ll be able to identify and address the immediate requirements to secure the network, achieve security best practises and cyber security standards (Cyber Essentials, ISO, NIST).

To find out how an **Asset Discovery Assessment** can help your organisation today, contact us and to book your consultation.

For the next step talk to us about our **Vulnerability Assessment** to gain a real-time overview of what vulnerabilities and which ones you need to address

“We could reduce our security system needs by 60% with Rebasoft”
