Delivering advanced IT asset management for improved security and operations.

Most organisations have incomplete visibility.

We all know that agent and scan-based asset discovery can lead to missing systems in your infrastructure.

The result is that security and operations teams are being asked to work on incomplete data.

This leads to security gaps, vulnerable systems and operational delays in managing and fixing IT systems.

Rebasoft gives you complete visibility:

1 **Find *all* your digital IT assets in real-time.**
(Network, endpoints, IoT devices)

Advanced asset inventory and discovery with hardware, software and application information, automatically kept up-to-date. This enables real-time security.

2 **Enables you to stay compliant and aligned to frameworks in real-time.**

Providing you the foundation for all compliance programs. Pre-built reports allow you to support Cyber Essentials, NIST, ISO 27001 and other standards submissions.

3 **Get ahead of lifecycle management.**

Use published information to track end-of-life/end of support for assets in the database. This enables better budgetary and security planning.
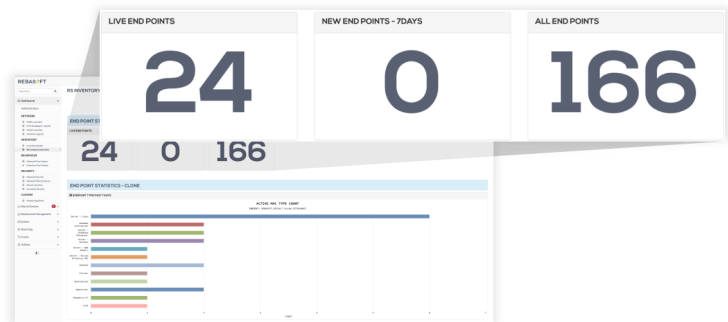

Benefits:

1 **Better discovery -** pick up and log every single device connection, no matter how infrequent.

2 **Security and operations on real-time information -** fix problems instantaneously.

3 **No scheduling scans -** no working around others.

4 **One solution for all your asset needs -** providing a single comprehensive location for all their asset data leading to less gaps, better coverage.

The Rebasoft asset management system

1. Asset discovery & inventory

With a seamless deployment, Rebasoft will show you every device on your network in real-time:

1. Provides agentless asset discovery.

2. Uses network infrastructure to build a highly accurate, real-time asset inventory.

3. Classifies systems based upon collected data.

4. Finds remote workers through MDMs like Intune.

2. Criticality & prioritisation

With Rebasoft you can set Business Importance (BIA) criteria for systems.

Make data-based decisions for spending and responding to cyber security issues.

3. Device details

Rebasoft collects and maintains detailed hardware and software information like:

1. Hardware model.

2. Location.

3. Operating system.

4. Installed applications.

5. Users, end-of-life and more.
